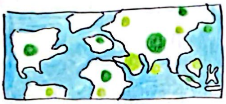
1. Ideas

1. proportional symbol map



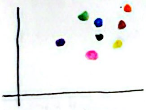
2. choropleth map

3. dot map

4. ranking table

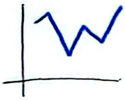
Cuisines	rating
1. Healthy	4.72
2. French	4.71
3. Pub	4.70

5. scatter plot



6. bar chart

7. line chart



8. donut chart

2. Filters :

a. choropleth map :
suitable for categorical attributes, but doesn't show restaurant-level distribution, only country avg

b. donut chart :
ratings are mostly 4.5 - 5, making the rest of the rating only show small portion of distribution

c. dot map :
for this dataset, the dots will be too sparse, hence no patterns in large area of the map.

3. Categorise

global distribution — proportional symbol map
↓
rating distribution — area chart, density chart
↓
top 10 global cuisines — bar chart, bump chart
↓
popularity vs quality — scatterplot

4. Combine and refine

a. Combine popularity, rating, and cuisine into a single analytical framework

b. refine focus to show relationship between popularity (reviews) and rating (quality)

c. use visualisations to enhance storytelling

d. Ensure interactivity (filters, checkboxes, dropdowns) for exploratory analysis

5. question

1. Does the dashboard provide valuable insight

2. Are there more complex and suitable charts to better capture trends and patterns within data?

3. Does it helps explore how restaurants and ratings across

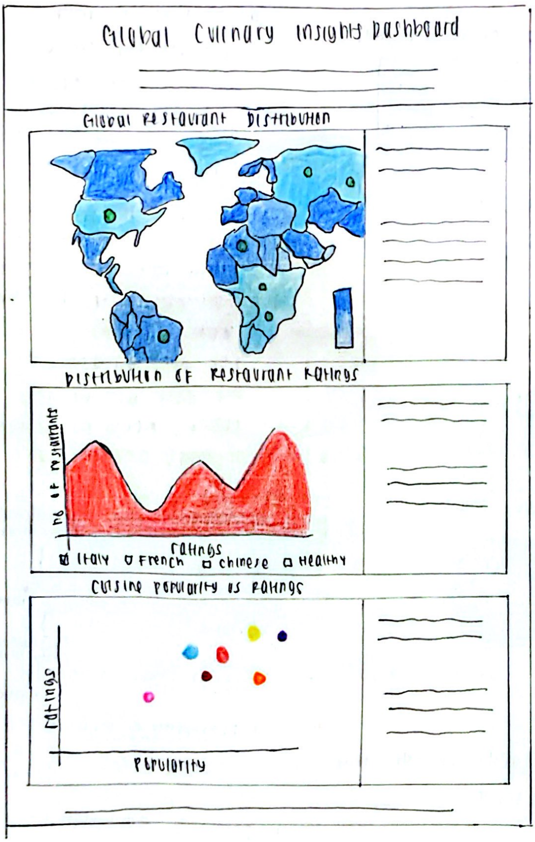
sheet: 1
Five design sheet viz. planning

title: Global Culinary Insights Dashboard
author: Calvin Wijaya
date: 20/10/2025
sheet: 2
task: 5DS V17. Planning (initial idea)

Layout



Operations

1. Combined all Vega-Lite specs using consistent height and width
2. Unified color schemes (blues and reds) for coherence and color-blind friendly
3. Interactive parameters for filtering cuisine types
4. Hover and tooltip interactivity

Focus

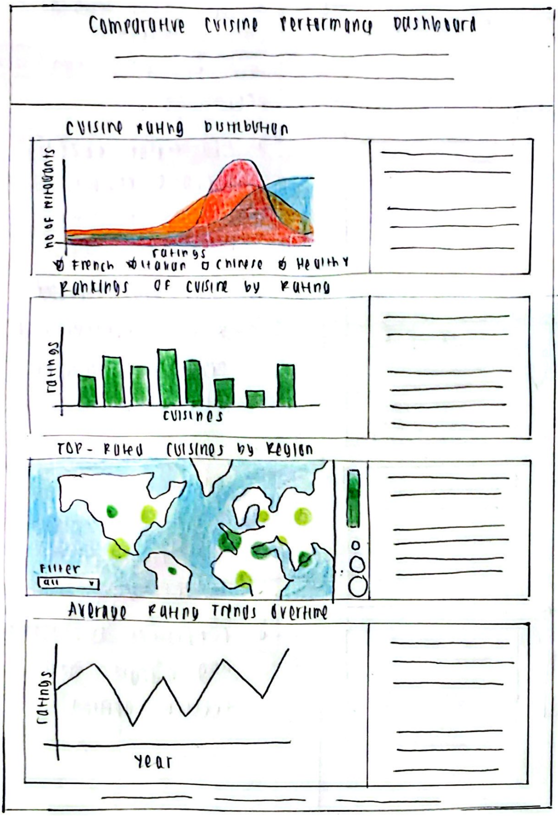
1. Provide an overview of the entire dataset through diverse visual idioms
2. Encourage users to explore spatial, distributional, categorical, and correlational perspective
3. Ideal as summary dashboard

Discussions

a. Pros:
- highly comprehensive, covering multiple data perspective
- ideal for exploratory insights and overview story telling

b. Cons:
- may overwhelm viewers due to density of visuals
- harder to maintain interactivity consistency

Layout



Title: Comparative Cuisine Performance Dashboard
Author: Calvin Wijaya
Date: 20/10/2025
Sheet: 3
Task: 5 DS Viz. Planning (Initial Ideas)

Operations

1. Density chart:
   interactive checkboxes for filtering cuisines
2. Bar chart:
   ranked by rating, with text annotations on bars.
3. Bubble map (proportional symbol map)
   Modified world projection highlighting top-rated cuisines by continent
4. Line chart:
   Plots mean ratings over-time or category for trend insights.
5. Hover and tooltips interactivity

Focus

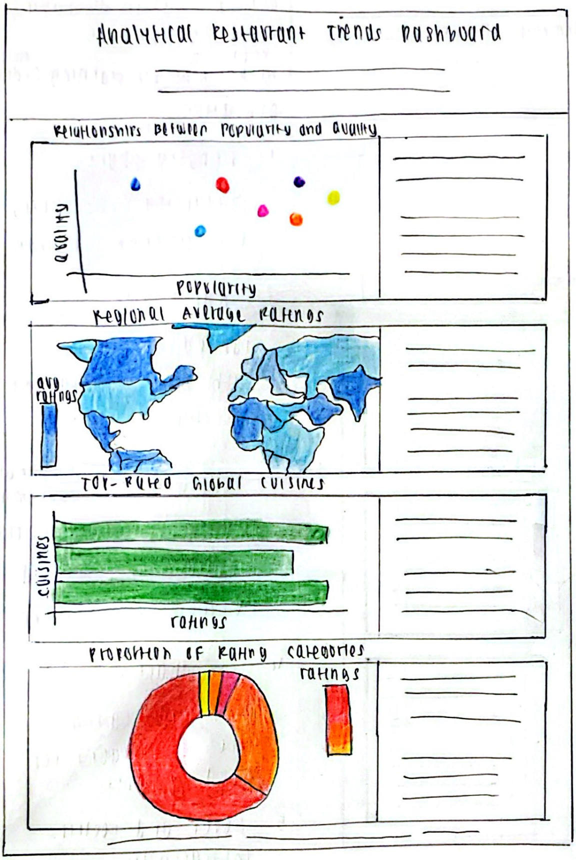
1. To tell a visual story of how cuisines perform, where they thrive, and how they evolve.
2. Ideal for understanding relationships between geography, quality, and consistency
3. Promotes a guided analytical journey.

Discussion

a. Pros:
- strong storytelling structures
- visual diversity makes each insight distinct
- smooth logical flow and low cognitive load

b. Cons:
- more scrolling required due to vertical flow
- overlapping filters may confuse viewers

Layout



title : Analytical Restaurant Trends Dashboard
author : Calvin Wijaya
date : 21/10/2025
Sheet : 4
task : 5ps vis. planning (initial idea)

Operations

1. Scatterplot encodes average reviews vs ratings, sized by restaurant count
2. Map uses TopoJSON with sequential blue scale for regional distribution
3. Bar chart visualises ranking ; donut chart summarises proportions of rating categories.
4. Consistent axis formatting, margins, and tooltips applied.

Focus

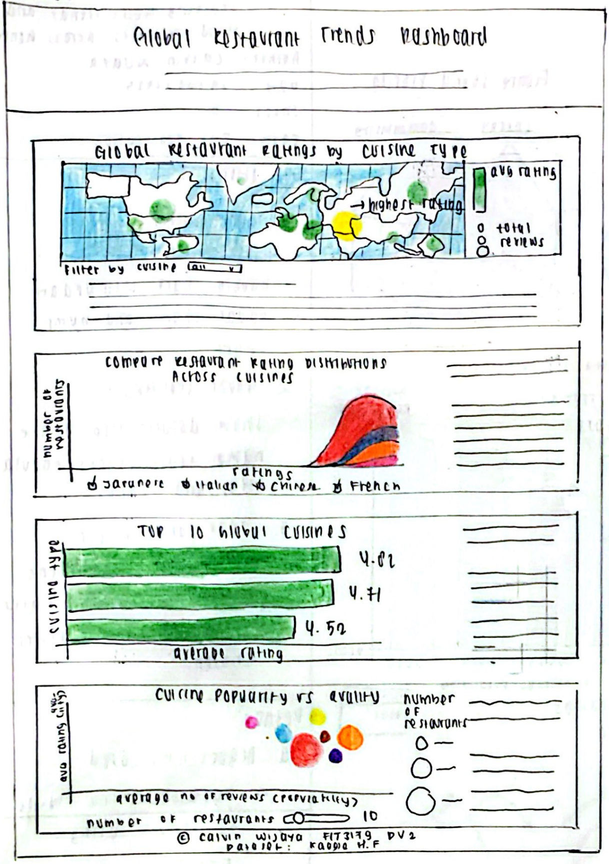
1. To analyse how different variables relate : quality, popularity, geography, and rating share
2. Supports simultaneous comparison across dimensions
3. Best suited for academic or evaluative analysis

Discussion

a. pros :
- Excellent for comparative analysis across multiple data perspective
- easy to maintain consistency and readability

b. cons :
- more analytical and less narrative
- donut chart's category is more towards higher

Layout



Title: Global Restaurant Trends Dashboard

Author: Calvin Wijaya

Date: 21/10/2025

Sheet: 5

Task: Five Design Sheet (Realization)

Operations

1. Custom parameters (checkbox filters, sliders) allow selective exploration of cuisines and data segments

☑ Japanese ☑ Chinese
☐ Italian ☐ French

no of restaurants 100

2. Tooltips provide contextual information on hover, enriching interpretability

3. Consistent color scheme
4. Metadata and dataset links are embedded in the footer.

Focus

1. The primary aim is to present a comprehensive narrative of global dining trends, how location, cuisine type, and customer rating interrelate.
2. Viewers can explore geographic reach, rating consistency, cuisine ranking, and popularity - quality dynamics in a single interface
3. The dashboard supports both exploratory interaction and guided analysis
4. Interactivity enhances understanding

Detail

a. Algorithms used
- Data cleaning using Python and R

b. Dependencies
- Vega-Lite for designing, building charts, and formatting data.
- Dashboard built using HTML and CSS

c. Estimated time
- Charts: 4-5 days
- Dashboard: 3-4 days

d. No specific requirements
